

Innocent Chinwendu Uguru

Machine Learning Engineer | Applied ML Engineer

 innouguru@gmail.com

 [08164998580](tel:08164998580)

 Jos, Plateau State, Nigeria

Skills

Machine Learning

Intermediate

scikit-learn, Random Forest, XGBoost, LightGBM, feature engineering, model evaluation, time-aware validation

Deep Learning

Intermediate

Pytorch, Torchvision, CNN, Transfer learning, Image classification

Python

Intermediate

Numpy, Matplotlib, Data analysis, Data preprocessing, Pandas

ML Deployment

Intermediate

FastAPI, Hugging Face

Development Tools

Intermediate

Git, GitHub, Jupyter, Google Colab, VSCode

Languages

Igbo

Native

English

Fluent

Summary

Machine Learning Engineer with hands-on experience developing and evaluating ML solutions using Python, scikit-learn, PyTorch, Pandas, NumPy, and DuckDB. Achieved 0.80 Precision@50 in a content opportunity scoring task, compared with 0.34 for a rule-based baseline, and 88.04% test accuracy in a 22-class plant disease classification task. Experienced in data analysis, model evaluation, computer vision, and deploying ML solutions into applications.

Education

University of Jos

Experience

FlyRank AI

Remote

Machine Learning Intern

1 July - 30 September 2026

- Developed a Random Forest model to identify content with potential future CTR recovery using Google Search Console and GA4 performance data.
- Built a time-aware ML pipeline using historical data, with October–December 2025 for training, January 2026 for model selection, and February 2026 as the final holdout period.
- Achieved 0.80 Precision@50 on the final holdout set, outperforming the rule-based baseline of 0.34 by 46 percentage points.
- Used Python, Pandas, DuckDB, and scikit-learn to process and model large-scale content performance data, working with a warehouse containing approximately 79 million rows.
- Evaluated the pipeline for data leakage and model reliability, and translated model outputs into actionable content-refresh recommendations.

Projects

Content Opportunity Scoring

2026

Built a machine learning solution to identify content with potential future CTR recovery using Google Search Console and GA4 performance data. Compared a Random Forest model with a rule-based baseline using Precision@50, achieving 0.80 Precision@50 versus 0.34 for the baseline. Used time-aware validation and Python, Pandas, DuckDB, and scikit-learn to process and evaluate large-scale content performance data.

Plant-GAI-AI — Plant Disease Classification

2026

Developed a deep learning image classification system for identifying plant diseases from leaf images across 22 classes. Trained a ResNet-18 model using PyTorch and transfer learning on 25,126 images, achieving 88.04% test accuracy and 87.89% best validation accuracy. Integrated the trained model into a web application using FastAPI, with React and Supabase supporting the application layer.
